

The glycemic index: a Samoan quick guide

What is the glycemic index?

The glycemic index (GI) is a guide to which carbohydrate foods break down into glucose slowly or quickly. It helps you choose which carbohydrate foods to eat to manage your diabetes and weight.

What are the benefits of lower GI foods?

Low GI foods are the best to eat because research shows they:

- break down into glucose slowly
- can make you feel full for longer

Ways to eat lower GI

- include a lower GI food at each meal*
- choose lower GI snacks (if you snack)*
- swap higher GI carbohydrate foods for lower GI varieties*
- buy products with the GI symbol (shown on the right) when possible.

Not all lower GI foods are healthier options, such as chocolate and chips, as they are higher in energy, saturated fat and salt. Examples of healthier options are shown on the following pages.

* Choosing lower GI foods does not mean you can eat as much as you like because the amount you eat also affects blood glucose levels. A dietitian can help.
